

2018 Course Selections

Girls' Weeks

STEAM Robotics Raceway

Instructor: James Dochtermann

Students will learn about the basics of electricity, simple machines, robotics and creating artwork. We will dismantle old electronic and mechanical toys, and other battery-powered electronics to salvage moving parts to create simple robots. Artwork will be created using some of the robots along with paper circuits, LED lights, 3D pens, and if time allows, computer aided design (CAD) and 3D printers. Additionally, we will fabricate electric-powered vehicles to have races and tug-of-war competitions.

Robot Challenge, Clean the Ocean

Instructor: James Dochtermann

Students will learn about environmental monitoring in local habitats and use the design engineering process to brainstorm ideas to solve local and global environmental problems. After a series of outdoor design engineering challenges, we will investigate how society can approach a large-scale problem using the Great Pacific Garbage Patch as an example. A small-scale model of the problem will be presented to the students and they will have to use resources available, such as mechanical and electrical parts, and if time

allows, computer aided design (CAD) and 3D printers, to create a waterproof robotic vessel to clean the ocean.

What's in the Sky?

Instructor: Jacqueline Rogers

Learn about the Wright Brothers as we discuss lift and what keeps planes in the air, and design your own balsa wood plane! We will also use everyday materials to move objects across the room, then create our own compressed air rockets. There is more than one way to fly!

Geology- More than Rocks in a Box!

Instructor: Jacqueline Rogers

This course will allow you to explore wonderful world of Geology. We will use a candy experiment to learn about igneous, metamorphic, and sedimentary rocks. Next you will learn to identify rocks using their physical features, and perform tests to compare them. Learn about the Earth's layers and create an example seismograph, then explore the field of paleontology.

We See 3D

Instructor: Christopher Beckwith

Campers will use TinkerCad to design a 3D model of something that could benefit them in another course. They may choose to design fins or a nose-cone for their rockets, a musical instrument, a puzzle, a component for their Rube Goldberg machine, playing pieces for a board game... whatever they imagine they can model in the application.

Throughout the week, the instructor will analyze the students' designs and help them refine their models for successful printing. Ultimately, each student will be able to print a 3D model of their design using 3D printers.

Welcome to Mars, your new home

Instructor: Christopher Beckwith

Participants will use Google Earth and other online resources to explore some of the topographical features of Mars, and by researching the existing conditions, they will determine the factors that must be considered to establish a sustainable human colony on the Red Planet. Following their research, the young colonists will then become specialists, each designing an essential component of a Martian colony. Communication and cooperation will be essential in developing the layout of

their colony as they build collaboratively on a specially designed Minecraft server with the Galacticraft/Mars plugin. The colonists will work side-by-side physically and virtually, racing against time to construct the necessary elements for survival and comfort on a hostile world. Their final test will be removing their oxygen masks to see if the oxygen systems they've constructed in their habitats can indeed sustain life.

Calculus in a Week: Holy Smokes!

Instructor: James Robertson

We are going to blast through calculus in a week! In this whirlwind tour of mathematics, we are going to take a few functions and learn how to take limits, derivatives and integrals. Don't know what those are? You will at the end of the week! You might even know more than your math teacher!

Operation Thermodynamics

Instructor: James Robertson

Your mission, should you choose to accept it, is to convert energy into work and work into energy. You will learn about the zeroth, first, and second laws of thermodynamics and how to use them to accomplish your mission.

Just Launch it

Instructor: Gary Kaszas

Students will create trebuchets/catapults in order to launch a projectile the farthest and with the most accuracy. They will complete their own design research, and construct them using materials supplied. By day 5 students will have applied Sine and Cosine, and eventually, at the end of the course be able to predict ballistic trajectories. Hopefully, we will not leave tennis balls on the roof of Limestone Community School!

The Bridge Explosion

Instructor: Gary Kaszas

Students will learn how engineers work and what goes into designing and building a complex, but a necessary structure that is used by people in all parts of the world every day. Students will use everyday items, such as, Popsicle sticks, toothpicks, straws, clay, cereal boxes, wood, playing cards...to build their bridges. They will also have to research different types of bridges, sketch

the bridge they envision, write a simple report that provides details on how their bridge will be used, how it makes life easier for everyday activities (and by people) and upon completion, explain the process it took to design and complete their bridge, and how they can improve their bridges.

Human Body Exhibit

Instructor: Jessica Prince

Did you know the human body creates over a liter of saliva a day, or that a baby's heart beats over 150 times a minute, or that the your belly button probably has over 60 different types of bacteria growing inside it? This course introduces you to the wonder of the human body. With hands on exhibits and activities, students will explore the digestive, circulatory, nervous, and musculoskeletal system. We'll use (and make our own) stethoscopes to listen to our heart and lungs, see how our mouths and stomachs digest crackers, candy, and other snacks, and learn how a set of nerves act together to move our arms and legs—sometimes without any awareness.

Guts, Blood, and Brains

Instructor: Jessica Prince

This class will learn about the human body and how it compares to other mammals. From there, we will dissect a pig heart, learning about the use and function of the different vessels, chambers, and features that make the human heart work.

Astronomical Adventure Tour

Instructor: Larry Berz

The overall thematic thrust of the week surrounds a hands-on vigorously interactive set of activities and lessons detailing those wonders of the Universe of singular interest to the middle school to early high school age student.

Reinforcement occurs throughout the evening, including observations with telescopes and unaided eye.

Lift-Off!

Instructor: Larry Berz

The return of the hands-on, interactive discovery approach investigation of model rocketry along with personalized applications. Special emphasis placed upon rocket design and engineering, construction, instrument making, experimenting, team-building, launch skills, and math applications. Emphasis also placed upon historical significance of American and Soviet (Russian) aeronautics and space exploration during the 1960s and 1970s to provide documented evidence of American and Russian technological achievement and national determination.

Lego Robotics

Instructor: Laurie Spooner

Legos and robots! What can be a better combination? You will use Lego Robotics kits to build and program your own competition machines. You will start building the first day and have the opportunity to participate in closest to the pin, maze runner, and tractor pull challenges. Along the way, we will talk about sensors, computer programming, and physics.

Lego Robotics Pentathlon (Advanced Robotics)

Instructor: Laurie Spooner

Are you ready to show off your building and programming skills? You and your team will work together to prepare for a pentathlon on the last day of class. Let's On the first day, you will be introduced to the five challenges and provided the Lego robotics kits. As the week progresses, you will plan, build, and program to become the MSSM Pentathlon Champion.

Let's Make a "Math-terpiece"

Instructor: Nicole Karod

We will discover different mathematics concepts through art, and will look closely at geometry with a focus on angles, the use of a protractor, scale and symmetry. Each math concept will create amazing art pieces.

You Can Do the Cube

Instructor: Nicole Karod

We will look at the math behind the cube, the algorithms, and you will learn how to solve the cube! Then students will choose a mosaic for the class to work on and by the end of the course we will have made a large mosaic made entirely from rubik's cubes!

Cracking the Genetic Code

Instructor: Kelci O'Neill

Hey there codebreakers! Have you ever wondered why you have freckles but your friends don't? Well the answer can be found in your personal genetic code, or your blueprint: DNA! Did you know that if you have blue eyes, you have the recessive gene for eye color? Did you know that the human genetic code goes on for 3 billion (with a B) units, and that you have five feet of DNA in every single one of your cells? Do you have a hitchhiker's thumb? What percentage of the class has a widow's peak? We will explore traits and genetics by making family trees with wizards and muggles, and tasting by taste testing things like cilantro and PTC paper! We will explore base pairs by making DNA bracelets and making a DNA model out of candy! We will learn about DNA replication by doing our own Jurassic Park lab! Lastly, we will extract our own DNA and make a necklace from our genetic material! If you have a hankering for human diversity, then *Cracking the Genetic Code* is the course for you!

Refrigerator Science: Not Your Average Soda and Mentos!

Instructor: Kelci O'Neill

You know how you leave food in the fridge for too long, and your parents call it a science experiment? Well they have never seen experiments like these! In *Refrigerator Science*, you will learn all about how to play with your food! We will learn about the different minerals your body needs when we make nails from our breakfast cereal! We will learn about macromolecules from our color changing milk experiment and our experiment

where we extract DNA from fruit! We will learn about different densities from our experiments with eggs and solutions, and our experiment in making a sugar rainbow! Sugar will also be used to make crystals in rock candy, and in our experiment in making liquid nitrogen ice cream! If you have an interest in chemistry, biological molecules, or just plain old food, this is the course for you! Bon Appetit!
